DSA03-Natural Language Processing

List of Lab Program

1. Write program demonstrates how to use regular expressions in Python to match and search for patterns in text.

Code:

```
import re

text = "Python is easy. I am learning Python programming."

# Match a pattern at the beginning

result1 = re.match("Python", text)

print("Match:", result1.group() if result1 else "Not found")

# Search for a pattern anywhere in the text

result2 = re.search("learning", text)

print("Search:", result2.group() if result2 else "Not found")

# Find all occurrences of a pattern

result3 = re.findall("Python", text)

print("Find All:", result3)
```

Output:
